

Spooky²

Pests & Mold Protocol

June 2016

by David Bourke

Introduction

The Spooky² Rife System is used mainly for human and animal health. Using leading-edge quantum physics techniques combined with the signal transmission/reception properties of DNA's dual helical coils, it's capable of killing pathogens, parasites, molds, and cancer cells in the body, removing toxins and heavy metals, and normalising organs and body systems.

These techniques are also perfect for killing environmental infestations and molds.

My own environmental experiments with Spooky² and the Spectrum Sweep Programs which led to this discovery started at the end of summer 2013 with finding a black mold growing on my natural wood and tiled floors. My home is the driest place I've ever lived in, so finding this was a shock.

The mold was sticky and couldn't be either swept or vacuumed – both bad ideas anyway. So the only way to deal with it was to get down on hands and knees to physically dislodge it, then very carefully clear one tiny area at a time.

Because I'm spinally disabled, this was out of the question for me, so I had to find another solution.

I took a sample of the mold and put it in a specimen tape, then inserted it into a home-made DNA Holder attached to an older UDB1108S Spooky generator I was using at that time. I then ran the CAFL Fungus and Mold set in an endless loop.

It took a month to six weeks with that less powerful frequency generator, but eventually the black mold turned grey, which means that it was dead.

A couple of weeks later, a correspondent whose home was infested with collembola (springtails) wrote to me at my personal website. She didn't have Spooky, but she did have a commercial Rife machine. So I instructed her how to set it up for remote operation, use a dead insect as the remote transmission DNA sample, then transmit a frequency set that had been reported by another correspondent to drive collembola larvae out of the body.

It worked – her home was cleared of collembola in a few days.

Shortly after the release of Spooky² and the Spooky Spectrum Sweeps, I noticed one morning that I had large black ants in an unused bedroom – I counted about 50-60 of them, all swarming up from under the floor.

So I decided that I'd try the same trick. I killed one, put it in a specimen tape, then ran the Spooky Spectrum Sweep non-stop.

The numbers dropped dramatically almost immediately, and within a week they were all gone.

I also noticed that my fresh organic produce was developing molds very quickly. So I did the same with two different types of mold – one blue, one white.

No more molds grow on my fruit and veggies now!

Another escapade was with hordes of red ants in my kitchen. A dual-Remote Spooky²-5M ran the Converge Sweep on two ant corpses, and they were all gone in three days.

After that, I had yet another ant infestation by a different species. Again, I dealt with it using Spooky², and they all disappeared from my kitchen – this time within five minutes. Since then, I've had another three ant infestations in my kitchen. Spooky² despatched all my unwelcome visitors within an hour each time.

They're invading from my garden, where they're very welcome to live unmolested. But I don't wish to share my home with them.

I also eradicated an infestation of pesky drain flies in my bathroom. I ran the sweep for 30 days, and my unwanted guest numbers reduced from 30-50 flies a day to zero.

I strongly suspect that there was most likely more than one gene pool involved in this particular infestation because of the length of time taken in comparison to other insects.

Nevertheless, no more drain flies!

How does it work?

Well, just like us, insects have bacterial and fungal symbionts in their gut to help them digest food. The Spectrum sweep Programs kill these symbionts very quickly, and suddenly the pests are starving to death in the midst of plenty.

Spooky² has also been used successfully to eradicate fleas. The Spooky Spectrum Sweep wasn't used in this case, but the CAFL frequency set for Fleas.

I found this interesting because it meant that insects for which a frequency set exists can be killed in the environment. Since there are frequencies for Bird Mites in the Spooky² database, this is good news for those infested both personally and environmentally with these dreadful pests.

It means that adults in the home will die at the same time as emergent larvae in the skin.

And because there are also Programs for dust mites (Dermatophagoides), it's also good news for asthma and allergy sufferers because it's a non-toxic way to quickly eradicate dust mites in the home – simply by putting a sample of dust in the Remote gathered from mattresses or close to beds.

Unfortunately, Spooky² is probably not going to be able to completely solve gardening problems. Outdoor infestations are far more likely to be composed of insects from many different gene pools, so only those genetically related to the transmission insect will be affected.

Two of our users have kindly allowed me to share their successes.

The first involves beetles which were infesting a piece of artwork, and the second details the removal of two dangerous molds in the basement of a user's home which was making the family seriously ill.

This is the sculpture. If you look closely at the bent leg on the left, you can see the holes left by the beetles. On the black plinth, you see some dead ones. When the clearance started, the sweep settings weren't quite correct, so progress was slow. However,

when they were amended, many more were driven out to die:

In the lady's own words: *"About every six months for the past 10 years, 20-30 beetles would come out of the sculpture. They would crawl around the enclosure for a few days and die. Until the Spooky Spectrum Sweep, I never had more than a few at a time. When several dead ones were placed in the Spooky Remote and the sweep was run, beetles exited pretty much every day."*

This job took three months. A very large long-term infestation like this means that vast numbers of eggs have been laid. The sweep can only kill feeding adults, not eggs, so these continued to hatch. For the last week of May 2016, however, only a few beetles have appeared. And this lady now also reports another success (immediate) driving out ants that were invading her home.

I'll let this friend speak for herself:

"This whole wall (8' x 40') was almost all black mold. This is what is left. It's about an 8-inch circle. You can see the raised areas that used to be mold..."

"We had a serious issue when we found that a water line running to our barn was leaking behind the walls of our finished

basement. When we tore down the drywall, it was horrifying. The day all the drywall was off, our Spooky² generators showed up and we started the remote killing with samples...

“Our two mold samples...one is black mold, which after checking this morning, is now gray. The other was some green mold from the same area...

“Last night I went to my basement to look at the mold situation. I found that about 99% of it has turned to a white powder (the raised stippled areas in the photo). The green and the black mold are almost gone now! I'm so happy!

“When I came back up after the inspection and started to tell my husband, I just started crying...we have been very sick and tired. This nightmare is nearly over. I felt so sick for the past few years, and a few times I thought I was near death. I'm soooooo happy! Thank you Spooky²!”

Note that the black patch in the photo which took longer to be killed than the rest is now also gone.

These two stories are just some of the many we've received from happy Spooky² users who removed infestations and molds from their homes – they're also the only two we're aware of where photos of the results were taken and subsequently shared with us.

And since seeing is believing, we're also sharing them with you.

The Spooky team has now made available the new Spooky² HomeCare Kit, designed specifically to deal with home insect pest and mold eradication. It consists of:

- 1 x Spooky²-5M frequency generator
- 1 x Spooky Boost 3.0
- 1 x Spooky Remote 1.1 scalar transmitter
- 1 x Spooky specimen tape

The kit is available [here](#) now.

The protocols

Insects:

Eradication requires a dead specimen of the infesting insect, preferably freshly killed. Place the corpse close to one end of the sticky side of a 1.5-inch length of specimen tape, then fold the tape over once lengthways so that it's sealed shut. Slide the tape into the Spooky Remote between the two green circuit boards such that the specimen lies beneath the white circular magnet protection pad.

Now go to Spooky2's **Preset Program Menu** and select a Preset (use the *Spooky Spectrum Sweep* Preset if the pest is unidentified). This will load the correct settings and frequencies for you. Tick the **Allow Channel Overwrites** checkbox, then click the pink/red **Channel** button below. The pink/red **Channel Control** panel will open. When you click the **Start** button, the panel turns green, showing that the Program is running (the **Channel** button also turns green). Run non-stop until successful.

Bird mites, rodent mites, and springtails become most active around dusk, so you'll have a better chance of catching one at this time. You'll find bird mites on ceilings and the tops of walls close the beds. If you don't know what your pest looks like, use [Google Image Search](#) to help.

Moulds:

Removal requires a specimen. You should wear a dust mask to avoid inhaling spores. Press one end of a 1.5-inch length of specimen tape firmly against a patch of mould so that a specimen sticks to the glue, then leave the area immediately. Fold the tape over once lengthways so that it's sealed shut. Slide the tape into the Spooky Remote between the two green circuit boards such that the specimen lies beneath the white circular magnet protection pad.

Now go to Spooky2's **Preset Program Menu** and select a Preset. This will load the correct settings and frequencies for you. Tick the **Allow Channel Overwrites** checkbox, then click the pink/red **Channel** button below. The pink/red **Channel Control** panel will open. When you click the **Start** button, the panel will turn green, indicating that the Program is running (the **Channel** button also turns green). Run non-stop until successful.
